

ABSTRACT

The present invention provides an information communication terminal etc. capable of projecting images utilizing a feature of image projection.

When projecting images at the time of receiving information during image
5 projection mode execution as such, incoming notification image data stored as dedicated
images for projection which are different from images to be displayed on the image section
119 are read from the internal memory 112, and an image projection unit 130 is controlled
to project the incoming notification image. When projecting the incoming notification
image, sound output means (voice processing unit 115 and speaker 117) may be controlled
10 to output incoming sound for image projection which is different from normal incoming
sound when projecting no image.
